- The compounds of formula I can be converted to salts, in particular pharmaceutically acceptable salts using procedures known to one of ordinary skill in the art. If the compounds of formula I have at least one basic center, they can form acid
- 35 addition salts. These are formed, for example, with strong mineral acids, such as sulfuric acid, phosphoric acid or a hydrohalic acid, with strong organic carboxylic acids, such as

alkanecarboxylic acids of 1 to 4 carbon atoms which are unsubstituted or substituted, for example, by halogen, for example acetic acid, such as saturated or unsaturated dicarboxylic acids, for example oxalic, malonic, succinic, maleic, fumaric, phthalic or terephthalic acid, such as hydroxycarboxylic acids, for example ascorbic, glycolic, lactic, malic, tartaric or citric acid, such as amino acids, for example aspartic or glutamic acid, or such as benzoic acid, or with organic sulfonic acids, such as alkane- (of 1 to 4 carbon atoms) or arylsulfonic acids, for example methane- or p-toluenesulfonic acid. Corresponding acid addition salts can also be formed having, if desired, an additionally present basic center. The compounds of formula I having at least one acid group (for example COOH) can form salts with bases. Suitable salts with bases are, for example, metal salts, such as alkali metal or alkaline earth metal salts, for example sodium, potassium or magnesium salts, or salts with ammonia or an organic amine, such as morpholine, thiomorpholine, piperidine, pyrrolidine, a mono-, di- or tri-lower alkylamine, for example ethyl-, tert-butyl-, diethyl-, diisopropyl-, triethyl-, tributyl- or dimethylpropylamine, or a mono-, di- or trihydroxy lower alkylamine, for example mono-, di- or triethanolamine. Corresponding internal salts may furthermore be formed. Salts which are unsuitable for pharmaceutical uses but which can be employed, for example, for the isolation or purification of free compounds I or their pharmaceutically acceptable salts, are also included.

All stereoisomers of the compounds of the instant invention are contemplated, either in admixture or in pure or substantially pure form.

It should be understood that the present invention includes prodrug forms of the compounds of formula I.

The compounds of the instant invention may be in the free or hydrate form, and may be obtained by methods exemplified by the following descriptions.

Compounds of formula I can be prepared by coupling a compound having the formula

II

with compound of formula

III

5

optionally in the presence of an acid scavenger such as diisopropylethylamine to form a compound of formula

IV

- 10 In formula III and/or IV and throughout the specification, Pro is a suitable protecting group such as triethylsilyl or *t*-butyldimethylsilyl; R^{2'} is hydrogen, hydroxyl, halogen, -CO₂R⁷, -CH₂OPro', or -O-Pro' where Pro' is a suitable protecting group such as benzyl or *t*-butyldimethylsilyl; and L is a leaving group
- 15 such as iodide, bromide, *p*-toluene sulfonate, mesylate or trifluoromethane sulfate.

- Compounds of formula IV, where Pro is triethylsilyl or *t*-butyldimethylsilyl are then sequentially deprotected to form compounds of formula I by first treatment with a source of
- 20 fluoride such as tetrabutylammonium fluoride in a solvent such as tetrahydrofuran or ammonium fluoride in a solvent such as methanol to remove the Pro moiety; and where R^{2'} is O-benzyl, hydrogenolysis in a solvent such as methanol using a catalyst such as Pd or Raney nickel or alternatively treatment with a
- 25 Lewis acid such as BBr₃ in a solvent such as methylene chloride to remove the O-benzyl group; and where R^{2'} is -CO₂R⁷, reduction with a reducing agent such as lithium borohydride in

a solvent such as tetrahydrofuran to generate compounds of formula I where R^2 is $-\text{CH}_2\text{OH}$.

Alternatively, compounds of formula IV may be prepared by initially coupling compounds of formula

5 V

with compounds of formula III to generate compounds of formula

VI

10

where $R^{2'}$ is not hydroxyl or CO_2R^7 followed by careful hydrolysis using a base such as lithium hydroxide in a solvent such as tetrahydrofuran/methanol/water to generate compounds of formula

15 VII

Subsequently compounds of formula VII are condensed with an appropriate aniline using standard protocols for derivatization of amino acids to generate compounds of formula IV.

20

A preferred method entails pretreatment of VII in a solvent mixture such as 1,2-dichloroethane/dimethylformamide with 1-hydroxy-7-azabenzotriazole and a water soluble carbodiimide at 0°C prior to reaction with the appropriate aniline. In some instances for compounds of formula VII where

25

$R^{2'}$ is O-Pro', it is preferable to deprotect the phenol prior to condensation with the aniline.

Alternatively, compounds of formula I may be prepared by stirring two equivalents of a compound of formula II with one equivalent of a compound of formula VIII

where L' is a leaving group such as bromide, iodide or chloride and R^{2''} is hydrogen, hydroxyl, halogen, -CO₂R⁷, or O-benzyl, to form compounds of formula

IX

Compounds of formula IX are then converted to compounds of formula I by sequential treatment with a reducing agent such as sodium borohydride (and in the case where R^{2''} is O-benzyl, subsequent hydrogenolysis using a catalyst such as Pd or Raney nickel to remove the O-benzyl group) in a solvent such as methanol; and where R^{2''} is -CO₂R⁷, reduction with a reducing agent such as lithium borohydride in a solvent such as tetrahydrofuran to generate compounds of formula I where R² is -CH₂OH.

Compounds of formula II where R³ is hydrogen may be prepared upon sequential treatment of compounds of formula X

with aqueous basic ammonium cyanide followed by acid hydrolysis as described by L.B. Crast et al., US. Patent 3,517,023 to produce compounds of formula

XI

which are then converted to the compounds of formula II, where R³ is hydrogen by using standard protocols for derivatization of amino acids.

Compounds of formula II where R³ is alkyl may be prepared upon sequential treatment of compounds of formula X with aqueous sodium cyanide and ammonium carbonate followed by heating with aqueous sodium or barium hydroxide as described by C. Bernhart et al., US. Patent 5,268,375 to produce compounds of formula XI.

All compounds of formula XI may be converted to compounds of formula II where R³ is alkyl using standard protocols for derivatization of amino acids; or converted to the compounds of formula V by heating in an alcohol such as ethanol containing a mineral acid such as HCl.

Compounds of formula II or V where R³ is alkyl can be prepared in high optical purity upon treatment of compounds of formula XI with a reagent such as acetic anhydride in a solvent such as water to produce compounds of formula XII

Subsequent resolution of XII in a solvent such as ethanol employing an optically active amine such as α-methylbenzylamine and subsequent hydrolysis in a solvent such as water containing a strong mineral acid such as HCl generates optically active compounds of formula XI.

Compounds of formula VIII can be obtained by treatment of a *p*-hydroxyphenyl alkyl ketone or a *p*-halophenyl alkyl ketone, with a nitrating agent such as fuming nitric acid at a temperature of about -20°C to 20°C preferably at about -20°C or 0°C depending on whether R^{2'''} is hydroxyl or halogen to generate a compound of formula

XIII

followed by, in the case of hydroxyl, optional alkylation with benzyl chloride in a solvent such as dimethylformamide or acetone in the presence of a base such as potassium carbonate to generate compounds of formula

XIV

Subsequent reduction of the compounds of formula XIII or XIV

- 10 in a solvent such as methanol using hydrogen in the presence of a catalyst such as platinum oxide or alternatively with stannous chloride in a solvent such as ethyl acetate followed by condensation of the reaction product or of a commercially available 3-aminophenyl alkyl ketone with a sulfonyl chloride in a solvent such as pyridine, generates compounds of the formula
- 15 XV

where R2'' is hydrogen, hydroxyl, halogen, or O-benzyl.

- Compounds of formula XV where R2'' is -CO2R7 can be prepared from compounds of formula XV where R2'' is bromine by heating with a Pd+2 catalyst and carbon monoxide in a solvent such as toluene /aqueous NaOH as described by V. Grushin, H. Alper, *Organometallics*, 12, 1890-1901 (1993) to generate the corresponding carboxylic acid which in turn can be transformed to compounds of formula XV where R2'' is -CO2R7 by employing procedures known to those having ordinary skill in the art. Compounds of formula XV where R2'' is -CO2R7 can be directly prepared from compounds of formula XV where R2''
- 20
- 25

is bromine by the method of A. Schoenberg, I. Bartoletti, and R.F. Heck, *J. Org. Chem.*, **39**, 3318 - 3326 (1974).

- Alternatively, compounds of formula XV where R^{2''} is -CO₂R⁷ may be prepared from compounds of formula XV where R^{2''} is O-benzyl by 1) sequential hydrogenolysis over a catalyst such as Pd in a solvent such as methanol; 2) conversion to the triflate upon reaction with trifluoromethanesulfonic anhydride in a solvent such as dichloromethane in the presence of a base such as pyridine; and 3) heating with Pd(OAc)₂ and 1,2-bis(diphenyl)phosphinoethane under an atmosphere of carbon monoxide in an alcohol solvent containing a base such as triethyl amine as described by U. Gerlach, T. Wollmann, *Tetrahedron Letters*, **33**, 5499-5502 (1992).

- Heating of compounds of formula XV in a solvent such as ethyl acetate containing cupric bromide, or with bromine in solvents such as methanol or tetrahydrofuran or methylene chloride generates all compounds of formula VIII where L' is bromine. Compounds of formula VIII may also be prepared according to A. A. Larsen et al., *J. Med. Chem.*, **10**, 462 (1967) or U.S. Patent 3,574,741.

Compounds of formula X are commercially available.

- Compounds of formula III where L is bromide or iodide are prepared in high enantiomeric purity from compounds of formula VIII where R^{2''} is hydrogen, halogen, -CO₂R⁷ or O-benzyl and L' is Br by treatment with borane using a solvent such as tetrahydrofuran with a chiral auxiliary agent such as the compound XVI

- (prepared as reported by E.J. Corey et al., *J. Org. Chem.*, **56**, 442 (1991)) to generate compounds of formula

XVII

Subsequent treatment of compounds of formula XVII with an iodide source such as sodium iodide in a solvent such as hot acetone followed by reaction with a silylating agent such as triethylsilyl or *t*-butyldimethylsilyl chloride in a solvent such as pyridine generates the compounds of formula III where L is iodide.

The references cited above are incorporated by reference herein.

Preferred compounds of formula I are those where R¹ is lower alkyl, R² is hydroxyl, R³ is lower alkyl and R⁴ is alkoxy.

Most preferred compounds of formula I are those where one of R⁵, R^{5'} and R^{5''} is $-(CH_2)_mPO(OR^6)OR^6'$; or the compounds of formula I where one of R⁵, R^{5'} and R^{5''} is $-(CH_2)_mPO(OR^6)OR^6'$, m is the integer 1 and the others are hydrogen; or the compounds of formula I where R¹ is lower alkyl, R² is hydroxyl, R³ is lower alkyl, R⁴ is alkoxy and one of R⁵, R^{5'} and R^{5''} is $-(CH_2)_mPO(OR^6)OR^6'$; or the compounds of formula I where R¹ is lower alkyl, R² is hydroxyl, R³ is lower alkyl, R⁴ is alkoxy and R⁵, R^{5'} and R^{5''} are independently alkoxy; or the compounds of formula I where R¹ is unsubstituted lower alkyl, R² is hydroxyl, R³ is unsubstituted lower alkyl, R⁴ is lower alkoxy and one of R⁵, R^{5'} and R^{5''} is $-(CH_2)_mPO(OR^6)OR^6'$.

The present compounds of formula I have activity at the beta 3 adrenergic receptor and are therefore useful, for example, in the treatment of diabetes, obesity, gastrointestinal diseases (such as inflammatory bowel disease, irritable bowel syndrome, nonspecific diarrhea, and peptic ulcer) and achalasia.

Thus a composition containing one (or a combination) of the compounds of this invention, may be administered to a species of mammal (e.g., humans) suffering from diabetes,

obesity, an intestinal hypermotility disorder or achalasia as treatment therefor.

A single dose, or two to four divided daily doses, provided on a basis of about 0.1 to 100 mg per kilogram of body weight per day, preferably about 1 to 15 mg per kilogram of body weight per day is appropriate. The substance is preferably administered orally, but intranasal, transdermal and parenteral routes such as the subcutaneous, intramuscular, intravenous or intraperitoneal routes can also be employed.

The compounds of this invention can be formulated in combination with β_1/β_2 adrenergic blockers such as propranolol and nadolol or stimulants such as salbutamol. The compounds of formula I can also be formulated in combination with centrally (CNS) or systemically active agents that reduce food intake, such as leptin.

The compounds of formula I can be formulated for use in compositions such as tablets, capsules or elixirs for oral administration, in sterile solutions or suspensions for parenteral or intranasal administration, or in transdermal patches. About 10 to 500 mg of a compound of formula I is compounded with a physiologically acceptable vehicle, carrier, excipient, binder, preservative, stabilizer, flavor, etc., in a unit dosage form as called for by accepted pharmaceutical practice. The amount of active substance in these compositions or preparations is such that a suitable dosage in the range indicated is obtained.

Based on the literature, it is expected that these compounds may be useful for other indications such as treatment of depression and stress, regulation of intraocular pressure, treatment of conditions associated with increased protein breakdown such as during convalescence after surgery, treatment of triglyceridemia, hypercholesterolemia, atherosclerotic and cardiovascular diseases, and increasing high density lipoprotein levels. In addition, it is expected that these compounds may be useful as feed additives for fattening or improving weight gain or increasing lean body mass in animals

and may therefore be used to decrease birth mortality and increase post-natal survival rates in animals.

In addition, based on the literature, compounds of formula I are expected to be useful for improving healing and preventing stomach ulcers (K. Kuratani et. al., *J. Pharmacol. Exp. Ther.*, 270, 559 (1994)). The compounds of formula I are also expected to be useful for regulating core temperature.

The following examples and preparations describe the manner and process of making and using the invention and are illustrative rather than limiting. It should be understood that there may be other embodiments which fall within the spirit and scope of the invention as defined by the claims appended hereto.

Example 1

(R), (S)-[[4-[[[2-Hydroxy-2-[4-hydroxy-3-[(methylsulfonyl)amino]phenyl]ethyl]amino]-2-(4-methoxyphenyl)-1-oxopropyl]amino]phenyl]methyl]phosphonic acid, diethyl ester, trifluoroacetate

A. 5-Methyl-5-(4-methoxyphenyl)hydantoin

To a mechanically stirred 1:1 mixture of EtOH/H₂O (3L) at 72°C was added sequentially (NH₄)₂CO₃ (1.45 kg, 15.1 mol), NaCN (248 g, 5.1 mol), and 4-methoxyacetophenone (323 g, 2.15 mol). The stirred mixture was heated at 72°C with monitoring by HPLC. After 67 hours, additional (NH₄)₂CO₃ (180 g, 1.88 mol) and NaCN (30 g, 0.61 mol) were added. After 70 hours, another portion of (NH₄)₂CO₃ (240 g, 2.5 mol) and NaCN (36 g, 0.73 mol) were added. After a total of 92 hours, the reaction mixture was cooled to 10°C and filtered. The filter

cake was washed with 6 L of H₂O prior to air drying to yield 461 g of pure title compound.

B. (S)- α -Amino-4-methoxy- α -methylbenzeneacetic acid, ethyl ester

5 To a suspension of 5-methyl-5-(4-methoxyphenyl)-hydantoin (90 g, 0.408 mol) in 360 mL of water was added solid NaOH (90 g, 2.246 mol) and the final solution was heated to reflux for 30 hours. After cooling to room temperature, 720 mL
10 of water was added; the solution was cooled to 10°C and the pH was adjusted to 9 with 2N HCl. Acetic anhydride (1.28 mol, 121 mL) was added dropwise as the pH was kept at 9 by simultaneous addition of 2N NaOH (1410 mL). After stirring the final solution for 1 hour at room temperature, a small
15 amount of insoluble material was removed by filtration through a Celite® pad which was then washed with water. The pH of the filtrate was adjusted to 1 with 12N HCl. After stirring for 15 minutes at 10°C, the precipitated material was filtered, washed with water (3 x 250 mL), and dried *in vacuo* at 40°C to
20 yield racemic α -acetamido-4-methoxy- α -methylbenzeneacetic acid (92.34 g, 95%, mp: 222°C). A suspension of racemic α -acetamido-4-methoxy- α -methylbenzeneacetic acid (90.3 g, 381 mmol) in 4515 mL of EtOH (50 v/w) was heated to 40°C (internal). To this suspension was added 49.12 mL (381 mmol)
25 of (L)-(-)- α -methylbenzylamine. The warm solution was seeded with a few crystals of (S)-(+)- α -acetamido-4-methoxy- α -methylbenzeneacetic acid and stirred at room temperature (24°C) for 24 hours. The desired diastereomeric salt was collected by filtration, washed with EtOH (2 x 75 mL) and
30 several times with Et₂O and dried *in vacuo* at 40°C to yield 38.95 g (57% optical yield). α_D : +67.8° (MeOH, c=1).

The above salt (78.42 g, 219 mmol) was suspended in 1427 mL of water and the pH adjusted to 1 with 2N HCl. After
35 stirring for 30 minutes at room temperature, the precipitated (S)-(+)- α -acetamido-4-methoxy- α -methylbenzeneacetic acid was collected by filtration, washed with water (2 x 164 mL) and dried *in vacuo* at 40°C in the presence of P₂O₅ to yield 51.44 g

(101%, mp: 239-240°C) α_D : +86.5° (Phosphate buffer pH=7 c=1).
